TERRACOTTA

For many millennia, terracotta has been used to create beautiful objects of art and earthenware. Indeed, the earliest examples of its use have been traced back to prehistoric times. In harnessing its paradoxes – how the clay can be worked both warm and cold, and how the result can be made to look either soft or severe – the outcome of our endeavours can be both traditional and modern, always surrendering to the proprietary attributes of the clay.

While always maintaining its typical colour, which ranges over different hues of reddish-brown depending on the iron content, our terracotta clay is made using a kaolin base. Its special properties ensure a durable and less porous surface. While in the kiln, it will coalesce, virtually eliminating water absorption. The minimal 3 to 4% water absorption of a Domani terracotta pot ensures that it is frost-proof, lending itself to year-round use in any climate.

Terracotta is a natural material that reacts to its surroundings, slowly developing its character from the mineral content of the water it is exposed to, giving it the almost human-like trait of slowly maturing into its own personality.

CORTEN STEEL

As the years come and go, the seasons pass and the weather changes, Domani's corten steel vessels are slowly brought to life. Their colour shifts gradually from steel grey to vibrant orange, then to dark red and finally to deep brown. Corten steel, fittingly also called weathering steel, is continuously transformed by the elements, getting more beautiful as time passes.

The metal alloy consists of iron, to which copper, phosphorus and chromium have been added, making it weather resistant. This resistance is caused by the oxidation that occurs when the metal is exposed to the elements. The wind and rain create the protective outer layer and patina which, in turn, eternally protects the base material against further weathering. In its initial stages, corten steel will shed some of its layer of rust. This process slowly subsides to form a stable base coat.

The oxidation process takes months, or even years, depending on the conditions. This is why all corten steel that we use in our manufacturing process has been treated to achieve the effect of approximately a year of natural ageing. The outcome is a steel structure that can be used outside for decades to come.

ZINC

Our admiration for zinc stems from its natural beauty. As it weathers, this smooth and shiny metal develops an attractive dappled patina. When zinc is exposed to humidity, natural oxidation occurs and it forms its own protective armour. As time passes, nature and the environment slowly adorn zinc with a unique and ever-evolving finish.

Since the beginning of time, zinc has been used to conceive ornate, decorative and useful objects through delicate craftsmanship. Practical uses of zinc can be traced back to ancient Greece, where variants of the supple metal were used to fabricate lightweight yet strong objects. Zinc is a highly sustainable choice. Refining it takes less energy than is needed by many other metals, and it is almost entirely recyclable.

The zinc used for Domani's pots contains titanium, which adds to its inherent high resistance to corrosion. This unique composition ensures that our zinc products have the ability to self-heal. The malleable characteristics of zinc lay the foundation for the way we form and finish the pots to a very exacting standard with strong and consistent joins.

TECHNICAL INFORMATION

All Domani items are handmade in our own European artisan workshop.

FROST-PROOF

All our terracotta and zinc collections have a drainage hole and are frost-proof.* Please note that some shapes need more care if they are planted and placed outside.

* Atlantis TAOP60 and TAOP80 in bronze and black metallic are made without drainage holes.

RUBBER FEET

All outdoor pots are delivered with rubber feet.

DIMENSIONS AND WEIGHTS

∅ This is the outside diameter of the pot.
Please note that dimensions and weights may vary due to natural shrinkage.

PLANTING ADVICE

SIZE OF THE POT AND PLANT

In order to match a plant with a pot correctly, it is very important to pass the interior measurements of the pot to the plant or tree grower. This will ensure that suitable plants are listed early in the design phase. This is also a perfect time to assess the intended location of the pot, allowing you to identify suitable plants to achieve the best results.

PREPARATION BEFORE PLANTING

To ensure good growth and the longevity of both the plant and the planter, it is always a good idea to insulate the inside of the pot using materials that protect against the cold and the heat in harsh climates.

Never insulate the bottom of the pot, as this will block the drainage holes or pipes. Standing water at the bottom of the pot will freeze in the winter and consequently damage the roots of the plant.

POTTING SOIL

It is best to use an airy potting soil made using a mix of black soil, peat, lava, argex and compost.

- For 10 m³ of potting soil:
- 3 m³ of black soil
 - 1 m³ of horticultural compost
 - 2 m³ of argex 8/16
 - 2 m³ of lava 16/32
 - 2 m³ of coarse fiber peat

Never place the plant too deeply in the pot. Covering the plant with too much soil will expose the stem to too much water and affect the air supply to the roots.

BARK CHIPS

Adding a thin layer of bark chips on top of the potting soil will protect the root ball against dehydration and will prevent excessive development of weeds.

AFTER CARE: WATERING

Plants in pots are generally sensitive to drought, mainly due to the limited space available for roots to develop and the relatively small amount of rainwater they receive. Watering is the most important thing for the successful development of plants in pots.

Drip irrigation is recommended, as the slow release of water ensures constant moistening of the root ball. If watered too little at a time, only the top layer of the root ball will be moistened and the rest of the roots will die.

The correct amount of water is not a set figure. Instead, it depends on the size of the plant and the pot, and their location. A general rule of thumb is to water two to three times per week by drip irrigation for roughly half an hour each time. Water in this way for as long as the season requires.

In high summer temperatures, plants will require more water and will need to be watered more regularly than they will in cooler winter temperatures. Also, be aware that dry climates and winds will dry out the soil faster.

AFTER CARE: FERTILISER

We advise adding a slow-release fertilizer to the soil in spring. This ensures a continuous supply of nutrients throughout the growing season. Always follow the instructions supplied by the fertilizer manufacturer carefully, and when in doubt, a lesser amount is better.

AFTER CARE: WINTER

Depending on how harsh the winter climate is, it may be a good idea to wrap the pot and plant with an insulating cloth to protect them against low temperatures and cold winds.

RUBBER FEET

To ensure firm and stable placement, all of Domani's pots and vessels come equipped with durable rubber feet. The composition of the rubber can withstand many years of exposure to the elements and will not deteriorate or lose its functional properties.

SAMPLE KIT

SAM – A BAG TO HOLD IT ALL

Sturdy yet supple, this spacious bag contains a sample set of Domani's full range of available colours and finishes – of both the L and S collection – the lookbook, a copy of the L catalog and the price list. The samples come in a roll-up bag for safekeeping, which is securely fastened with thin leather straps on the outside.
